Accessibility Platform Progress Report

SEN0421 | Project SDS-09 | Report R01 | Stages 1 through 5

17 October 2026 | Release 0.2.0

Team leader: İbrahim Mutlu | Student ID 2200005270

1 Progress and stage achievement

Implementation through stage 5 is complete. The application now scans a public web page, displays and filters accessibility findings, preserves audit history in SQLite and reports contrast evidence. The interface, current documentation and report are in English. Verification passed 14 application tests and one assessment-ledger test, plus the browser interface checks described in Section 3.

The report records SDLC achievement, standards alignment and team responsibility allocation as required by the instructor. Five of the fourteen planned milestones are complete; milestone counts do not represent an effort-weighted project completion percentage.[1]

Stage	Delivered capability	Acceptance evidence
1	Local development environment and fixture audit	Known fixture yields 5 violations; corrected fixture yields 0 automatic violations.
2	Public URL scan in restricted static mode	Validated IP pinning, checked redirects/resources and negative network tests pass; live example.com scan succeeds.
3	Findings interface	Rule/criterion, impact and element filters, WCAG links, HTML/selectors and needs-review separation pass browser checks.
4	Persistent scan history	SQLite migration and list/detail API work; a report survives database and API restart.
5	Contrast analysis	Ratios, colors and normal/large text thresholds are shown; uncertain backgrounds require review; boundary tests pass.

Current scope

The scanner audits one page of static HTML and CSS. Site scripts, frames, service workers and authenticated states are excluded. Blocked resources are disclosed as partial rendering. Automated results and contrast samples do not establish full WCAG conformance. Keyboard behavior analysis, human screen reader verification and automatic remediation remain in later stages.

[1] Instructor reporting requirement supplied by the team leader: reports should reflect achievement in the software development life cycle, alignment with standards and the division of responsibilities within the team.

2 SDLC progress and standards alignment

Requirements are recorded in docs/SCOPE.md and stage acceptance criteria in docs/ROADMAP.md. The first implementation uses an iterative sequence: define a bounded requirement, implement it, add relevant checks, then record evidence. The current release is a verified local prototype.

SDLC activity	Achievement in this reporting period	Evidence
Planning and requirements	Scope, limitations, fourteen milestones and acceptance criteria recorded.	SCOPE.md and ROADMAP.md
Design	Browser/API/scanner/store responsibilities separated; network policy and data schema defined.	src/app.ts, network.ts and store.ts
Implementation	Stages 1 to 5 delivered with English interface and documentation.	Release 0.2.0 source files
Verification	15 tests, browser workflows and a live URL smoke test passed.	Section 3 and reports/evidence/
Deployment and maintenance	Local startup and scheduled continuation configured; production deployment remains outside this release.	Start.cmd and AUTOMATION.md

Architecture and traceability

The browser sends a scan request to the Express API. The URL loader validates the target and supplies intercepted responses to Chromium. Axe-core produces rule findings; a separate sampler records contrast evidence. The API stores the resulting JSON and summary in SQLite. The interface retrieves reports through list and detail endpoints.

Requirement or standard	Implementation and verification	Qualification
WCAG 2.1 A and AA	axe-core uses wcag2a, wcag2aa, wcag21a and wcag21aa tags.	Only applicable automatic rules are evaluated.
WCAG 1.4.3 Contrast Minimum	Luminance ratios, 4.5:1 and 3:1 thresholds, exact size-boundary tests.	Complex backgrounds and semantic exceptions require review.
WCAG 1.1.1, 3.1.1 and 4.1.2	Fixtures exercise missing image alternatives, page language and form/button names.	Correct meaning and screen reader experience are not inferred.
ISO IEC 40500 editions	2012 maps to WCAG 2.0; 2025 maps to WCAG 2.2.	Neither edition is identical to WCAG 2.1; no ISO certification is claimed.
Secure URL retrieval	Public-address validation, direct IP connections and per-hop checks.	Application safeguards follow OWASP guidance; no security certification is claimed.

3 Verification results

All checks below were executed on 17 October 2026 with Node.js 24.12.0, TypeScript, Playwright Chromium and axe-core. Dependency versions are fixed in package-lock.json. The built-in SQLite API is experimental in this Node version and is tracked as an operational limitation.

Check	Result	Evidence location
TypeScript and application tests	Passed 14 application tests with 0 failures.	npm run verify; tests/
Assessment ledger invariant	Passed; scores stay 5 to 9 and final averages equalize.	tests/assessment.test.ts
Known and corrected fixtures	5 known rule violations; 0 on the corrected fixture.	artifacts/demo-report.json
Network restrictions	Private/reserved/mixed DNS, rebinding, redirects, budgets, cancellation and deadlines checked.	tests/network.test.ts and scanner.test.ts
Persistence and API	Restart, pagination, detail retrieval, invalid input, Host/origin and concurrency checks pass.	tests/api.test.ts
Browser workflows	Filters, incomplete results, history reload and JSON download pass.	reports/evidence/ui-verification.txt
Interface accessibility	No automatic A/AA violations in tested desktop/mobile states; keyboard entry and 390 px overflow check pass.	scripts/verify-ui.ts and screenshots
Live public page	example.com returns 0 violations, 6 passed rules and 0 incomplete rules; 1 request, 577 bytes, no blocked resources.	artifacts/public-url-report.json

The live page result is a smoke test of the public URL path. It does not validate other websites or prove that example.com fully conforms to WCAG. Browser workflow checks do not replace a full keyboard or screen reader audit.

Contrast evidence

Controlled case	Calculated ratio	Required ratio	Result
Black on white	21.00 to 1	4.5 to 1	Pass
White on white	1.00 to 1	4.5 to 1	Fail by formula
RGB 119 119 119 on white at 16 px	4.48 to 1	4.5 to 1	Fail
Same colors at 24 px	4.48 to 1	3 to 1	Pass
Same colors at 18.667 px bold	4.48 to 1	3 to 1	Pass
Gradient or translucent background	Not resolved	Context dependent	Manual review

Decisions use the unrounded ratio. A maximum of 500 visible HTML text samples is examined per page; reaching the cap is disclosed. Disabled controls are recorded as not applicable. SVG/canvas text and complex visual composition are not automatically certified.

4 Team responsibilities and next work

İbrahim Mutlu is the confirmed team leader. The allocation below is proposed for team confirmation and gives each member a distinct area to maintain or review. It is not a claim that a particular member authored the implemented changes. Individual contribution records should be supported by commits, review notes or task records before submission as measured team performance.

Member	Student ID	Proposed responsibility
Emre Men	2500002908	Requirements and standards traceability
İbrahim Mutlu	2200005270	Team leader, integration and planning
Alper Özkan	2300006148	URL scanner and request policy
Gökhan Seçkin	2300008057	Findings interface and accessibility
Erdinç Karagülle	2400005708	Persistence schema and history API
Göktuğ Dal	2400005048	Contrast analysis and regression testing

Operational limits and risks

The server listens on localhost. One audit may run at a time. The loader permits public HTTP/HTTPS on ports 80/443, at most four redirects per resource, forty requests, 2 MiB per response and 10 MiB per scan. A resource has a six-second inactivity timeout and the scan has a thirty-second deadline. Cross-origin and unexpected Host requests to the local application are rejected.

Dynamic pages may be incomplete because site scripts and frames are disabled. Image/gradient/transparency cases can need human contrast review. SQLite schema version 1 is migrated transactionally, and a newer schema is refused. The next release should retain these restrictions while expanding accessibility explanations.

Remaining milestones

Stage 6 adds accessible-name and ARIA explanations. Stage 7 adds keyboard behavior evidence. Stage 8 adds persistent human-verification records. Stages 9 and 10 add suggestions and local remediation with diffs, undo and rescans. Stage 11 adds bounded site crawling. Stage 12 expands report exports. Stages 13 and 14 cover regression packaging and the course delivery package.

Daily development remains scheduled for 10:00 Europe/Istanbul, starting from stage 6. Future progress reports and peer-assessment entries will be generated when the team leader requests them. Real screen reader verification remains not tested.

5 Illustrative peer assessment

The scores below are simulated allocations requested for report planning. They are not measured individual performance, verified contributions or instructor grades. No performance narrative is inferred from a random score. The team should replace them with evidence-based peer assessment if the course requires actual contribution scoring.

Member	Student ID	R01 score out of 9	Current mean
Emre Men	2500002908	6	6.00
İbrahim Mutlu	2200005270	7	7.00
Alper Özkan	2300006148	9	9.00
Gökhan Seçkin	2300008057	8	8.00
Erdinç Karagülle	2400005708	7	7.00
Göktuğ Dal	2400005048	5	5.00

Every score is an integer from 5 to 9. This report assigns 42 points in total, a mean of 7 across six members. Individual current means differ because this is the first entry.

Equal final averages

The ledger in docs/assessment-ledger.json preserves each report without altering past scores. After n non-final reports, each member's cumulative total remains within two points of 7n. For the final report, that member receives 7 minus the existing deviation. This final score is always between 5 and 9, and every final total becomes exactly 7 times the total number of reports. Each member therefore finishes with an identical average of 7.00, even if the number of reports changes.

The balancing rule was tested with series of 1, 2, 3, 6, 17 and 50 reports. It applies only to this illustrative simulation; it must not be described as an independent measurement of contribution.
